

Assessing Source Zone Natural Attenuation and Source Zone Longevity

Paul Johnson¹, Paul Lundegard², Zhuang Liu¹, Roberta Lenski³, Paul Dahlen⁴

¹-ASU, ²-Unocal/Independent, ³-ASU/Carollo, ⁴-ASU/AFCEE, ⁴-ASU/soon-to-be-Golder

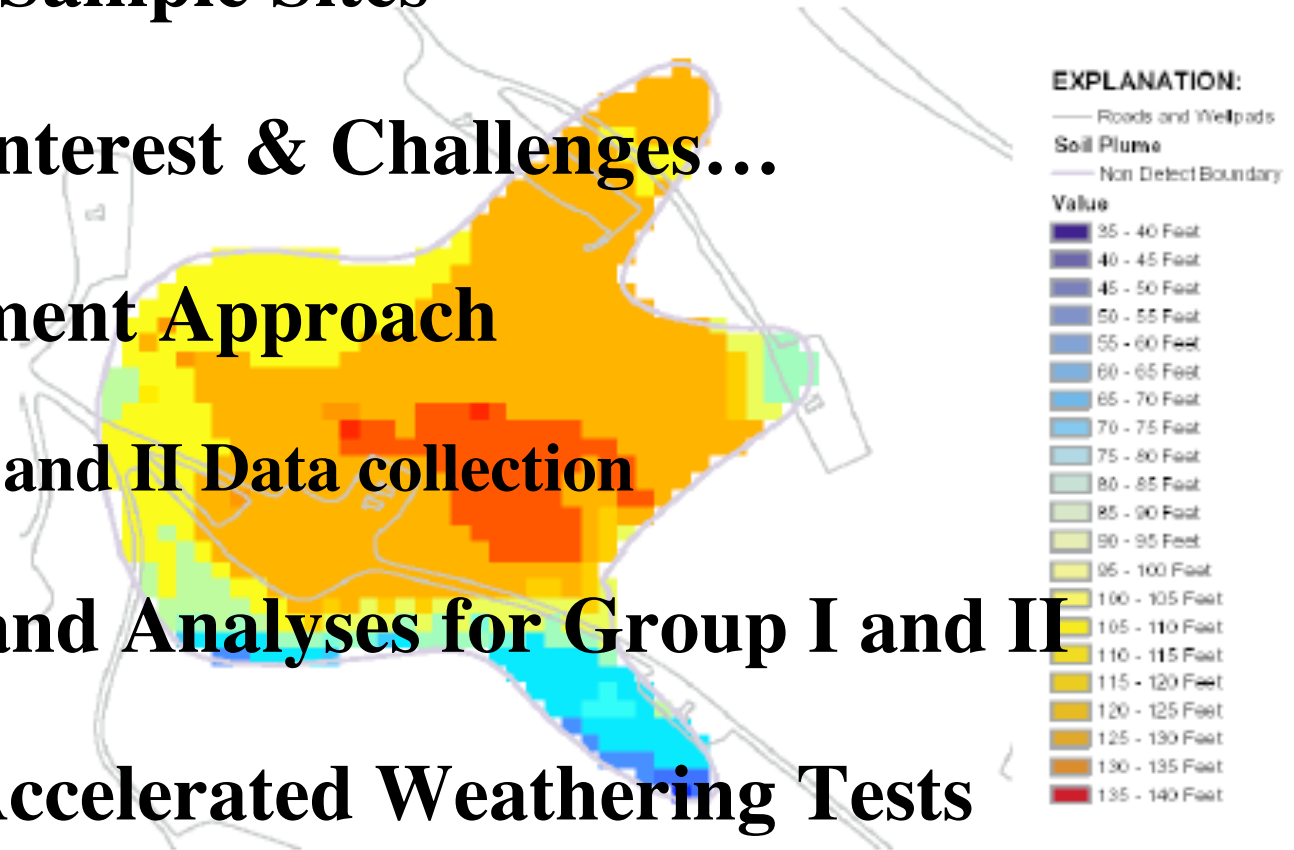

This work was sponsored by Rio Tinto (Thanks to Stuart Rhodes!) and the company formerly known as Unocal (now Chevron)

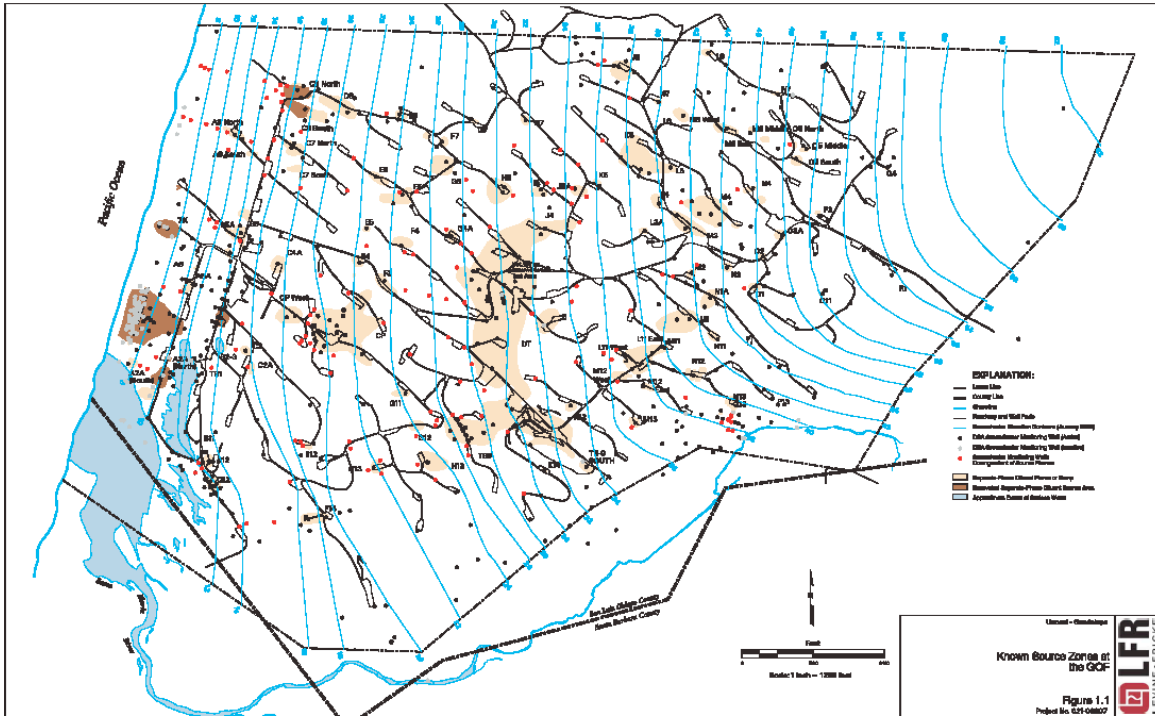

Outline

- Motivation & Sample Sites
- Questions of Interest & Challenges...
- SZNA Assessment Approach
 - ✓ Group I, II, and II Data collection
- Sample Data and Analyses for Group I and II
- Bench-Scale Accelerated Weathering Tests
- In Progress...

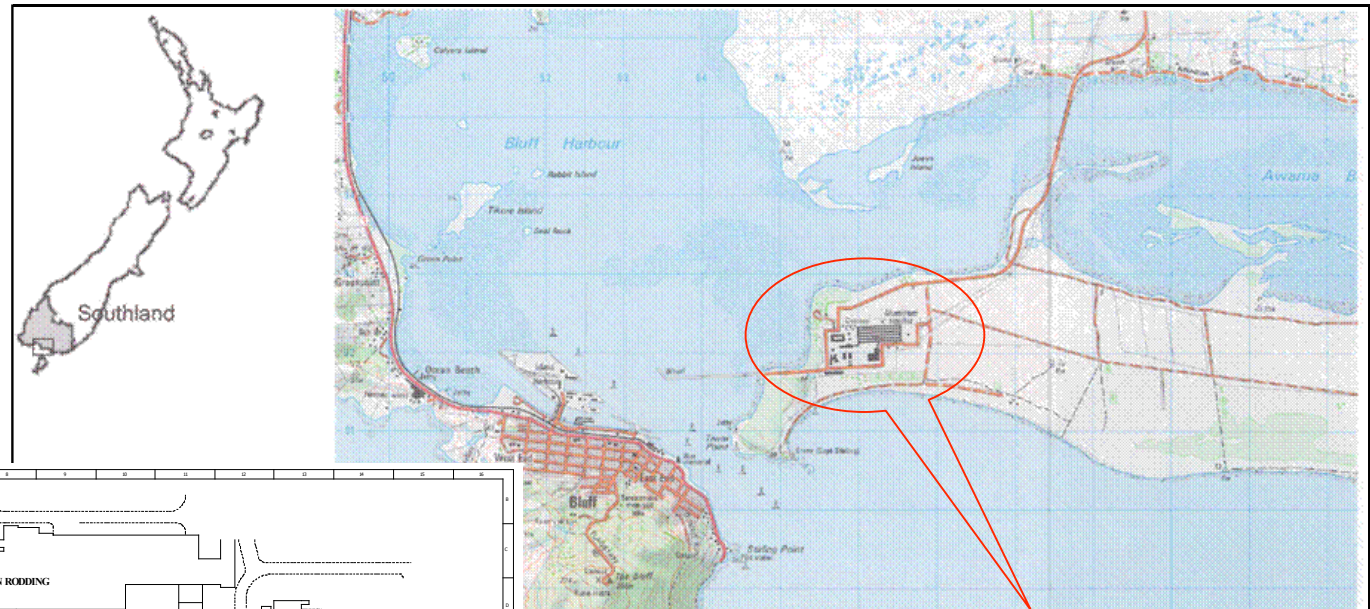

Guadalupe Restoration Project, CA

[about 25 square miles and 100 source zones]

New Zealand Aluminium Smelters Site

300,000 L
Diesel Release

Tiwai Point Smelter, Southland, New Zealand

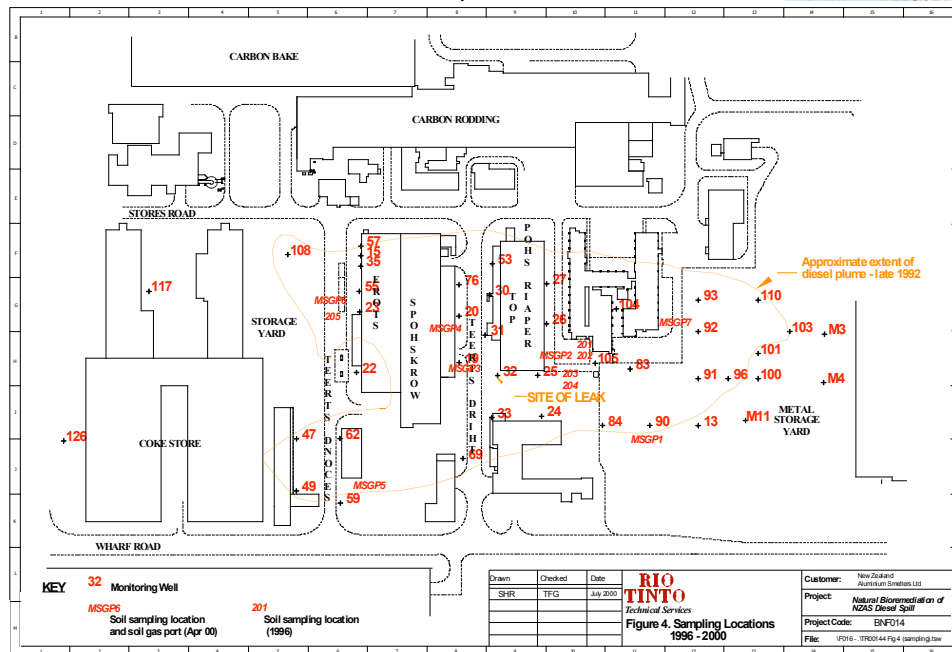

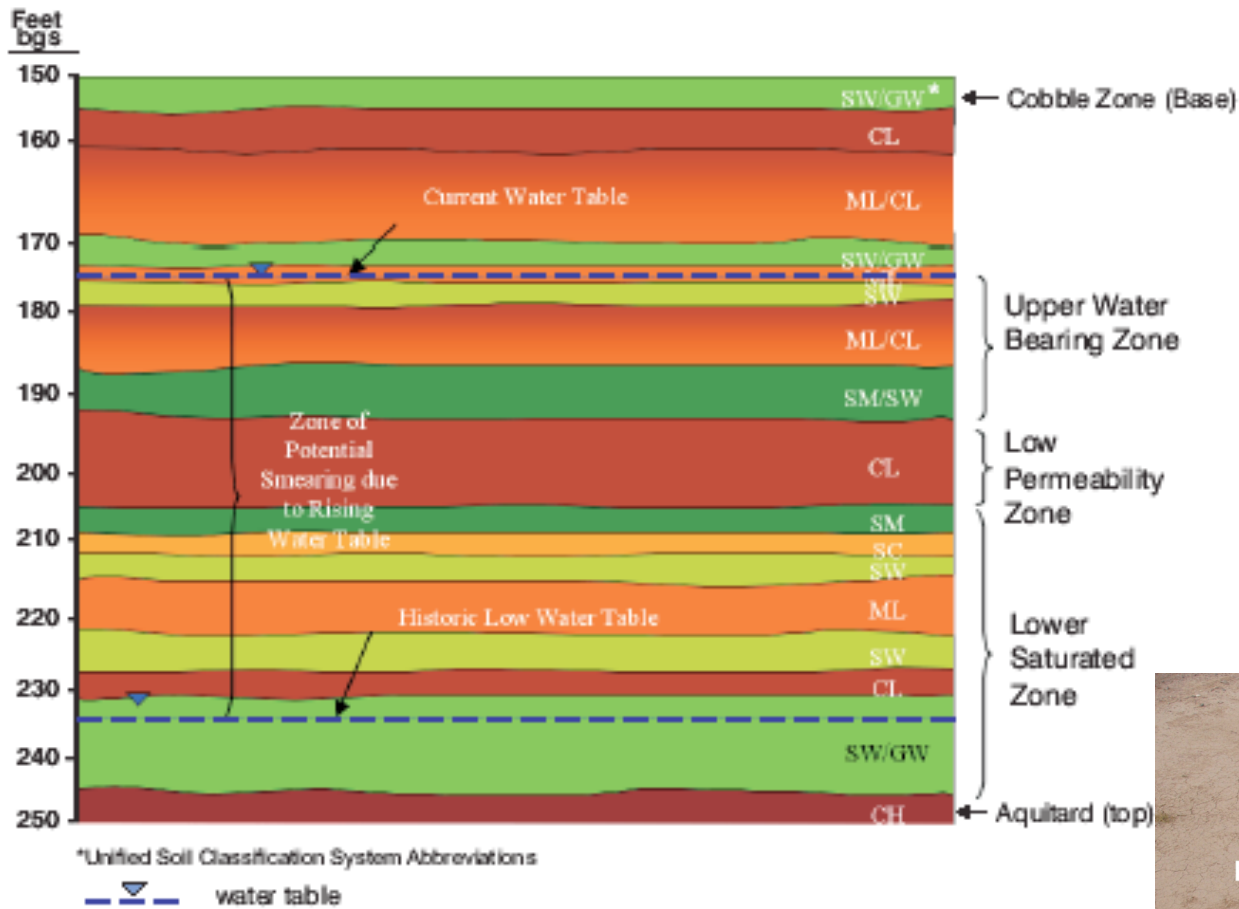

Photo source: Rio Tinto website, <http://www.riotinto.com/default.aspx>;

Turlough F. Guerin and Stuart Rhodes, 2000. Natural bioremediation of NZAS diesel spill – Draft. Rio Tinto Technical Report

Former Williams AFB ST-12 Site

[650,000 - 1,400,000 gal of aviation fuels (JP-4 and AVGAS)]

Relevant Questions...

- Is SZNA occurring?
- What are the rates of SZNA of key chemicals and cumulative mass?
- What are the implications for long-term groundwater quality?
- Are the SZNA processes sustainable?
- At what point in the future will groundwater quality goals be met?

Generalized Conceptual Model

A Simplified View of SZNA Processes...

SZNA Framework...

A data-driven/multiple lines of evidence approach is used. Any projections are anchored in data.

Data gathering and data reduction activities are grouped by their usage.

-
- Group 1:** Measurements that indicate that natural attenuation has been, or is currently occurring in the source zone
- Group 2:** Measurements that help assess the current rate(s) at which source zone natural attenuation is occurring and the sustainability of the processes
- Group 3:** Measurements that are indicative of long-term effects of source natural attenuation processes on the future extent, duration, and magnitude of impacts associated with the source

- dissolved hydrocarbon concentrations
- changes in electron acceptors & transformation products (O_2 , Fe^{2+} , Mn^{2+} , SO_4^{2-} , NO_3^- , CH_4)
- groundwater table elevation

SZNA Group II (rates)

(in addition to Group I)

aquifer characterization data (hydraulic conductivity)

SZNA Group III (future projections)

(in addition to Groups I and II)

Modeling...

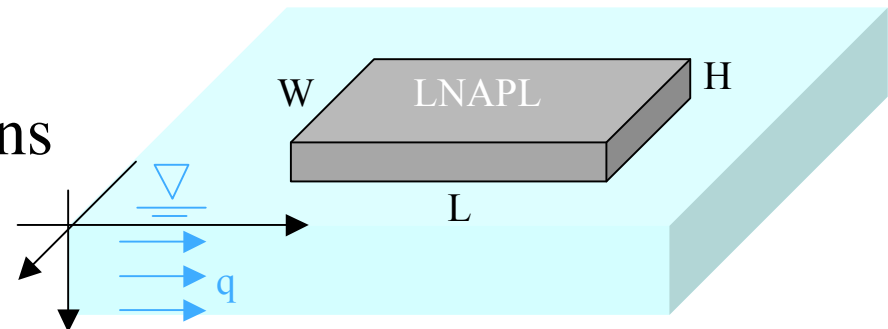

Data Reduction...

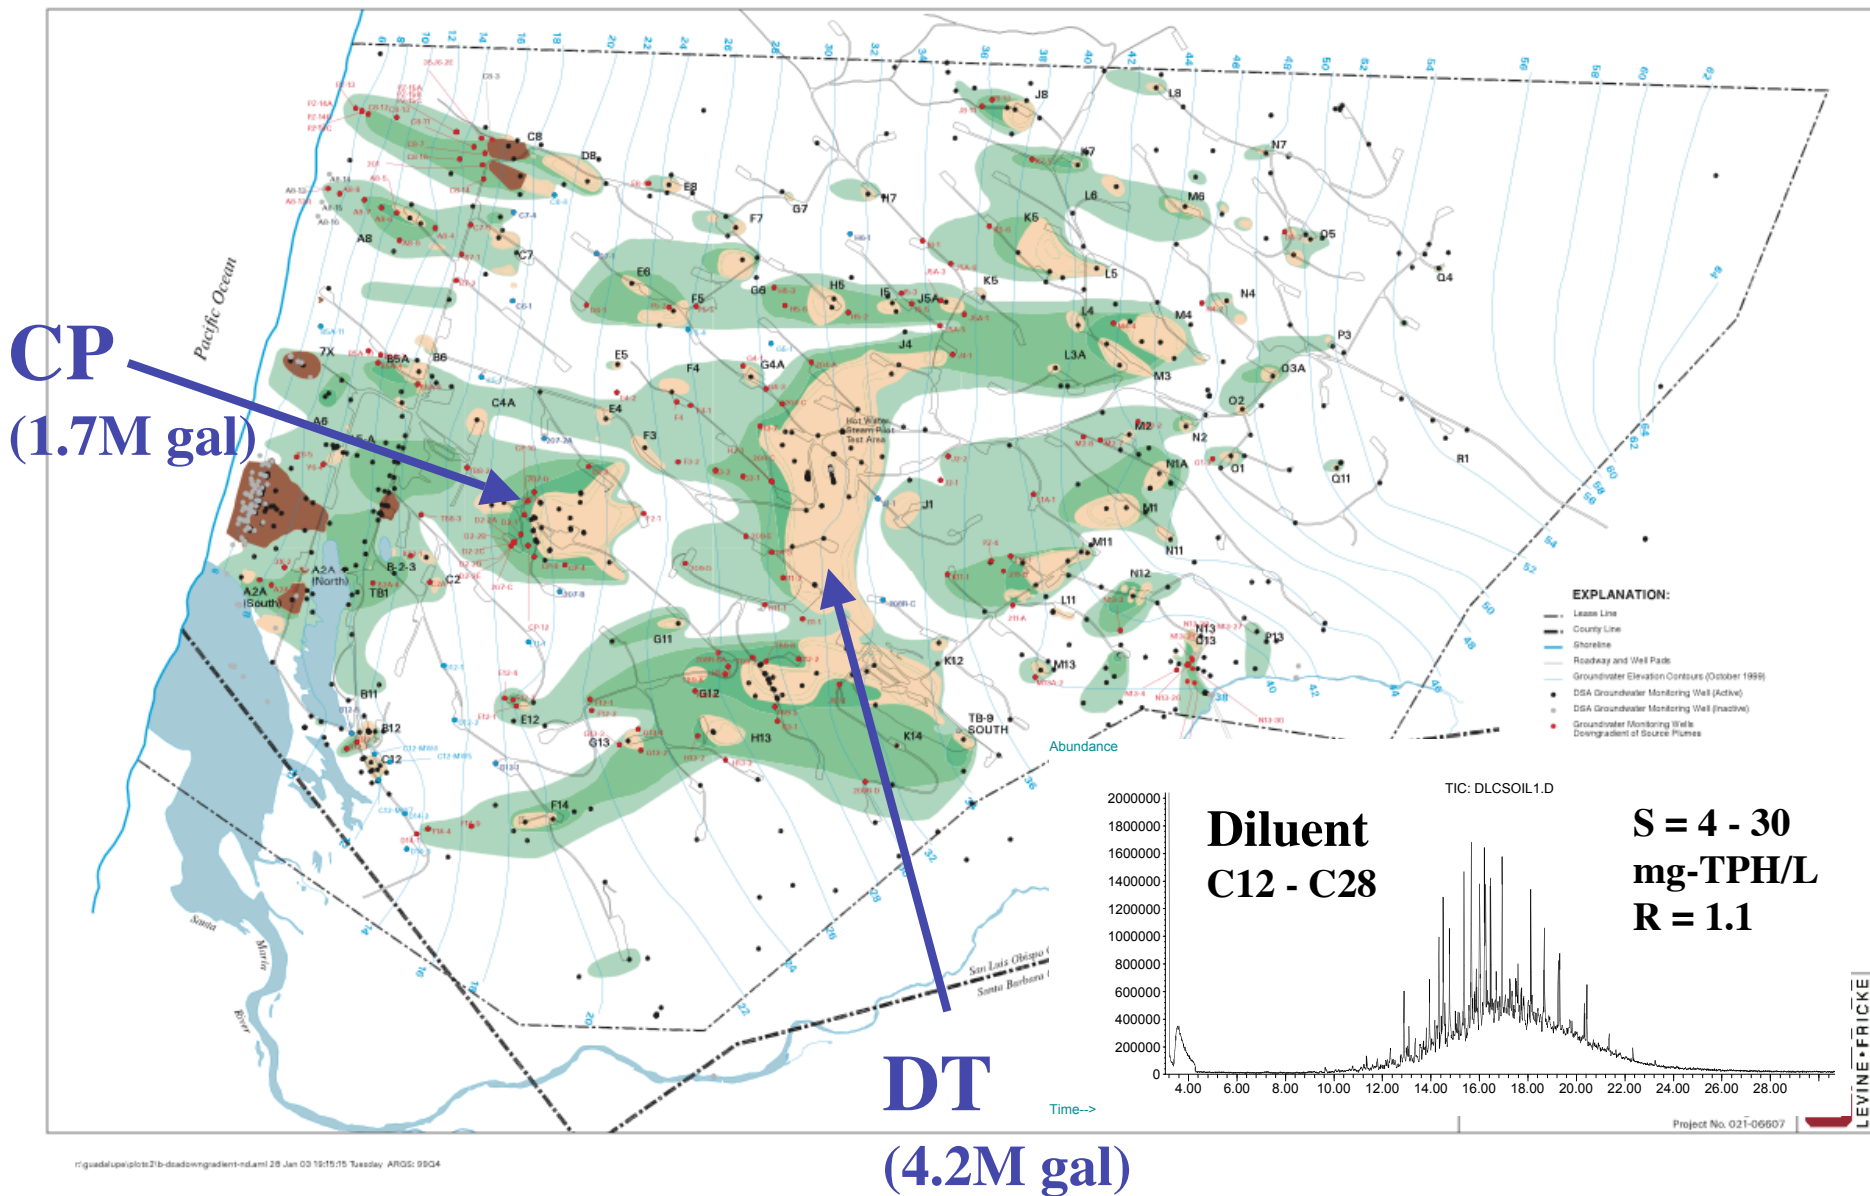

Group 1: Typically charts and tables showing that measurements (dissolved concentrations, soil gas concentrations, composition of residuals, spatial relationships) are consistent with what is expected if SZNA is occurring.

Group 2: Mass balance and simple order-of-magnitude mass transport calculations

Group 3: Time-scale conversions

Source Zones at GRP

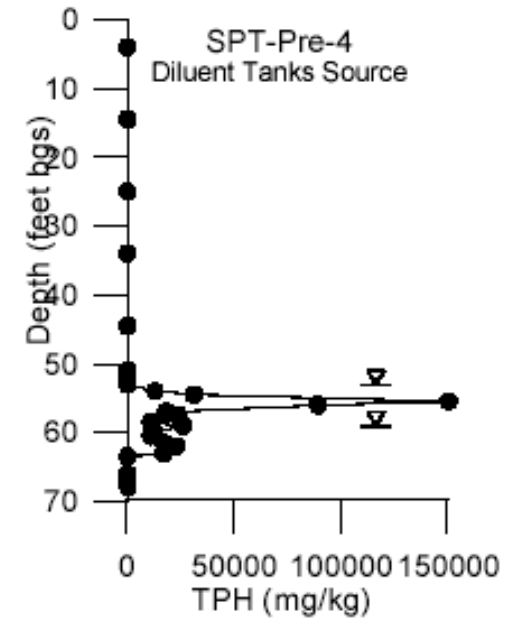

Sample Group I

Data from GRP...

(SZNA occurrence)

| | Oxygen (mg/L) | Alkalinity (mg/L CaCO ₃) | Iron (mg/L) | Nitrate (mg/L) | Sulfate (mg/L) | Methane (mg/L) |
|---|---------------|--------------------------------------|-------------|----------------|----------------|----------------|
| Conventional Monitoring Wells Up-gradient of Source Areas | | | | | | |
| Data Points | 341 | 194 | 54 | 194 | 194 | 0 |
| Median | 3.7 | 180 | 0.04 | 18.2 | 30 | --- |
| Minimum | 0.04 | 56 | 0.02 | 2.2 | 11 | --- |
| Maximum | 11.0 | 400 | 0.83 | 93 | 220 | --- |
| Conventional Monitoring Wells Down-gradient of Source Areas | | | | | | |
| Data Points | 255 | 158 | 35 | 158 | 158 | 0 |
| Median | 0.3 | 325 | 16 | 2.2 | 9.2 | --- |
| Minimum | 0.01 | 48 | 3.6 | 0.4 | 1 | --- |
| Maximum | 5.8 | 690 | 45 | 14 | 160 | --- |
| Nested Wells Up-gradient of DT Source Area | | | | | | |
| Data Points | 5 | 5 | 5 | 5 | 5 | 5 |
| Median | 2.4 | 197 | 0.19 | 6.1 | 44 | 0.003 |
| Minimum | 0.8 | 172 | 0.06 | 1.9 | 23 | 0.001 |
| Maximum | 6.7 | 245 | 3.32 | 40 | 76 | 0.014 |
| Nested Wells Within and Down-gradient of DT Source Area | | | | | | |
| Data Points | 23 | 26 | 26 | | 26 | 26 |
| Median | 1.2 | 476 | 14.7 | 1.9 | 9 | 6.7 |
| Minimum | 0.5 | 280 | 0.13 | 1.5 | 0.7 | 0.130 |
| Maximum | 5.2 | 608 | 78 | 6.5 | 106 | 13.3 |

Not shown - dissolved TPH data, groundwater elevations, chromatographic comparisons of residual TPH, etc.

TPH Profiles in Soil

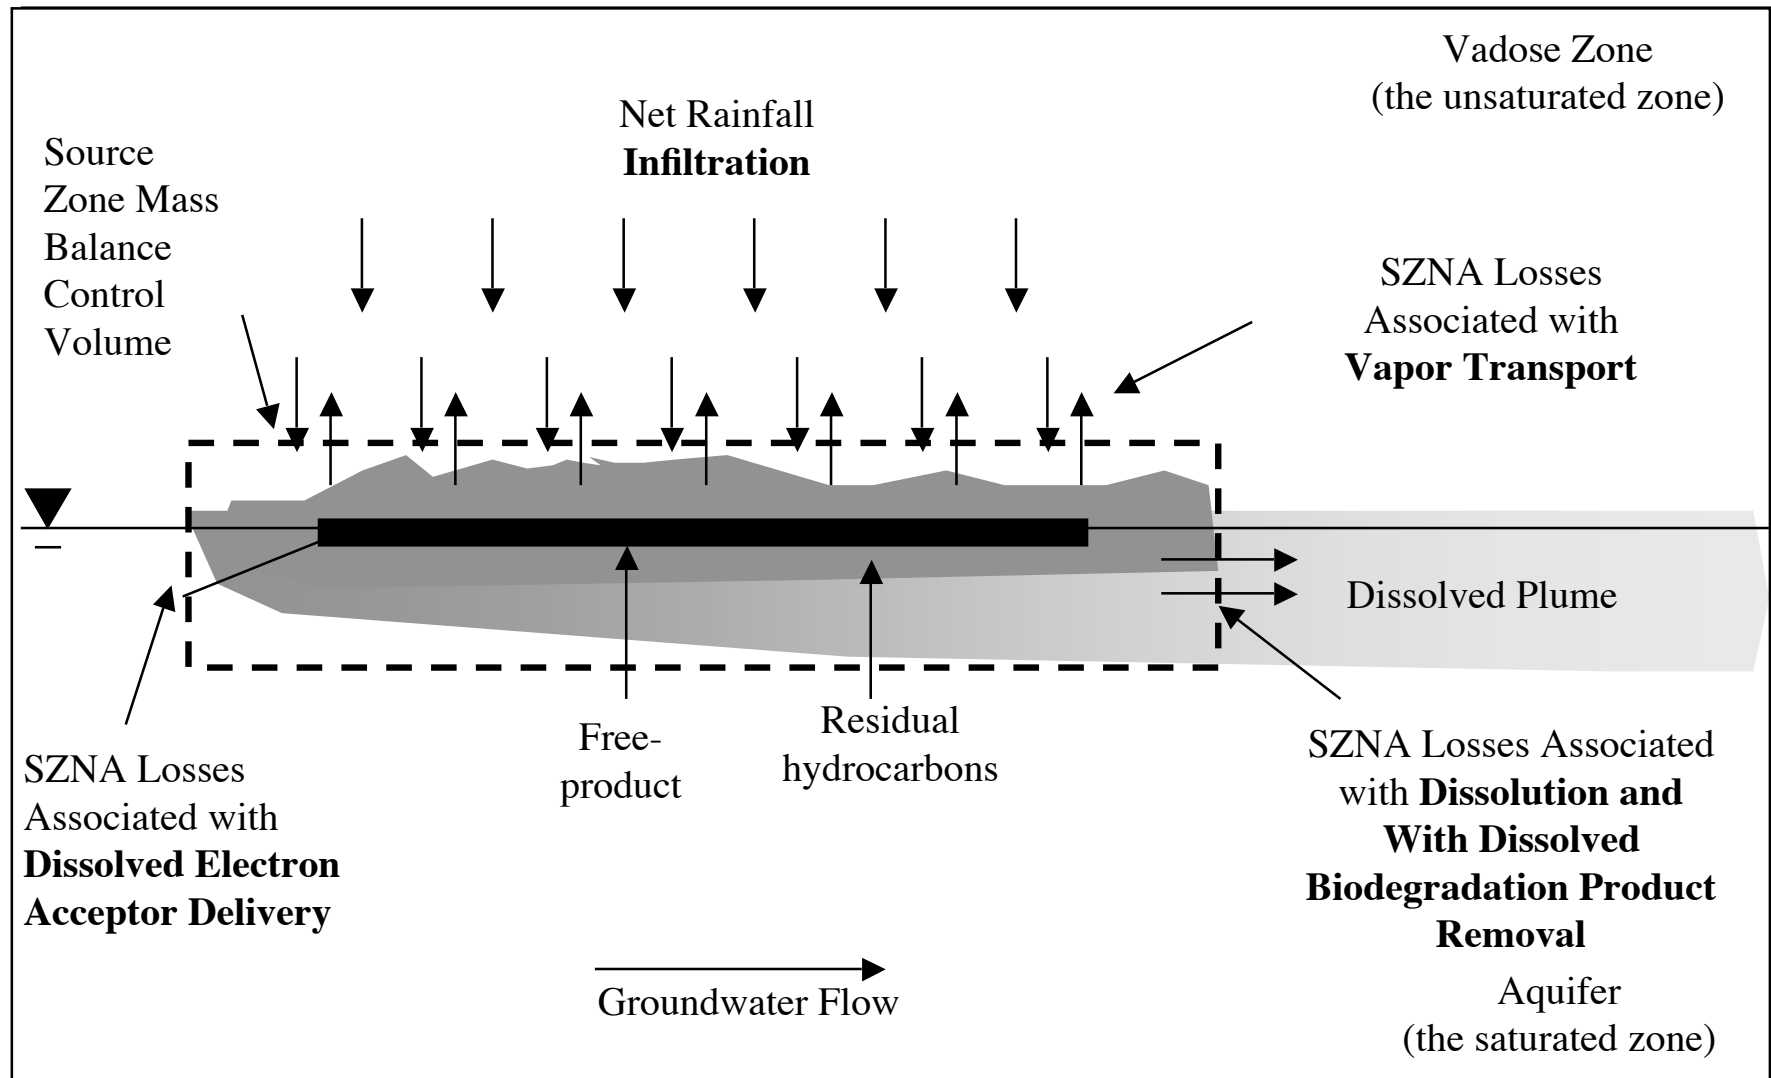

Soil Gas Profiles

Group II Data Reduction...

(use of macroscopic mass balances with field data)

Sample Group II Data Reduction - Dissolved-Transport-Related Processes..

Plan View

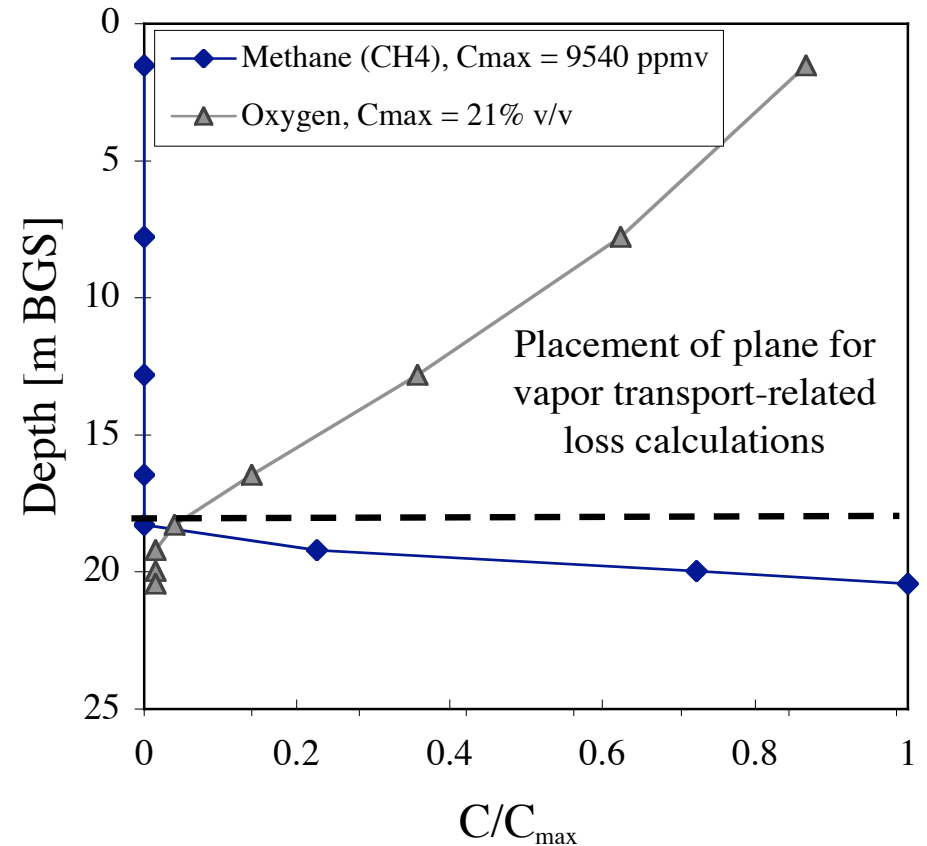

Cross-section A-A' (w/exaggerated vertical scale)

$$\begin{aligned}
 R_{\text{bio-sat}} = & \int_{WH} \int q_u \{ [S_O C_{O,u}] + [S_N C_{N,u}] + [S_S C_{S,u}] - [S_I C_{I,u}] - [S_{Mn} C_{Mn,u}] - [S_M C_{M,u}] \} dzdy \\
 & + \int_{WL} \int q_R \{ [S_O C_{O,R}] + [S_N C_{N,R}] + [S_S C_{S,R}] - [S_I C_{I,R}] - [S_{Mn} C_{Mn,R}] - [S_M C_{M,R}] \} dx dy \\
 & - \int_{WH} \int q_d \{ [S_O C_{O,d}] + [S_N C_{N,d}] + [S_S C_{S,d}] - [S_I C_{I,d}] - [S_{Mn} C_{Mn,d}] - [S_M C_{M,d}] \} dzdy
 \end{aligned}$$

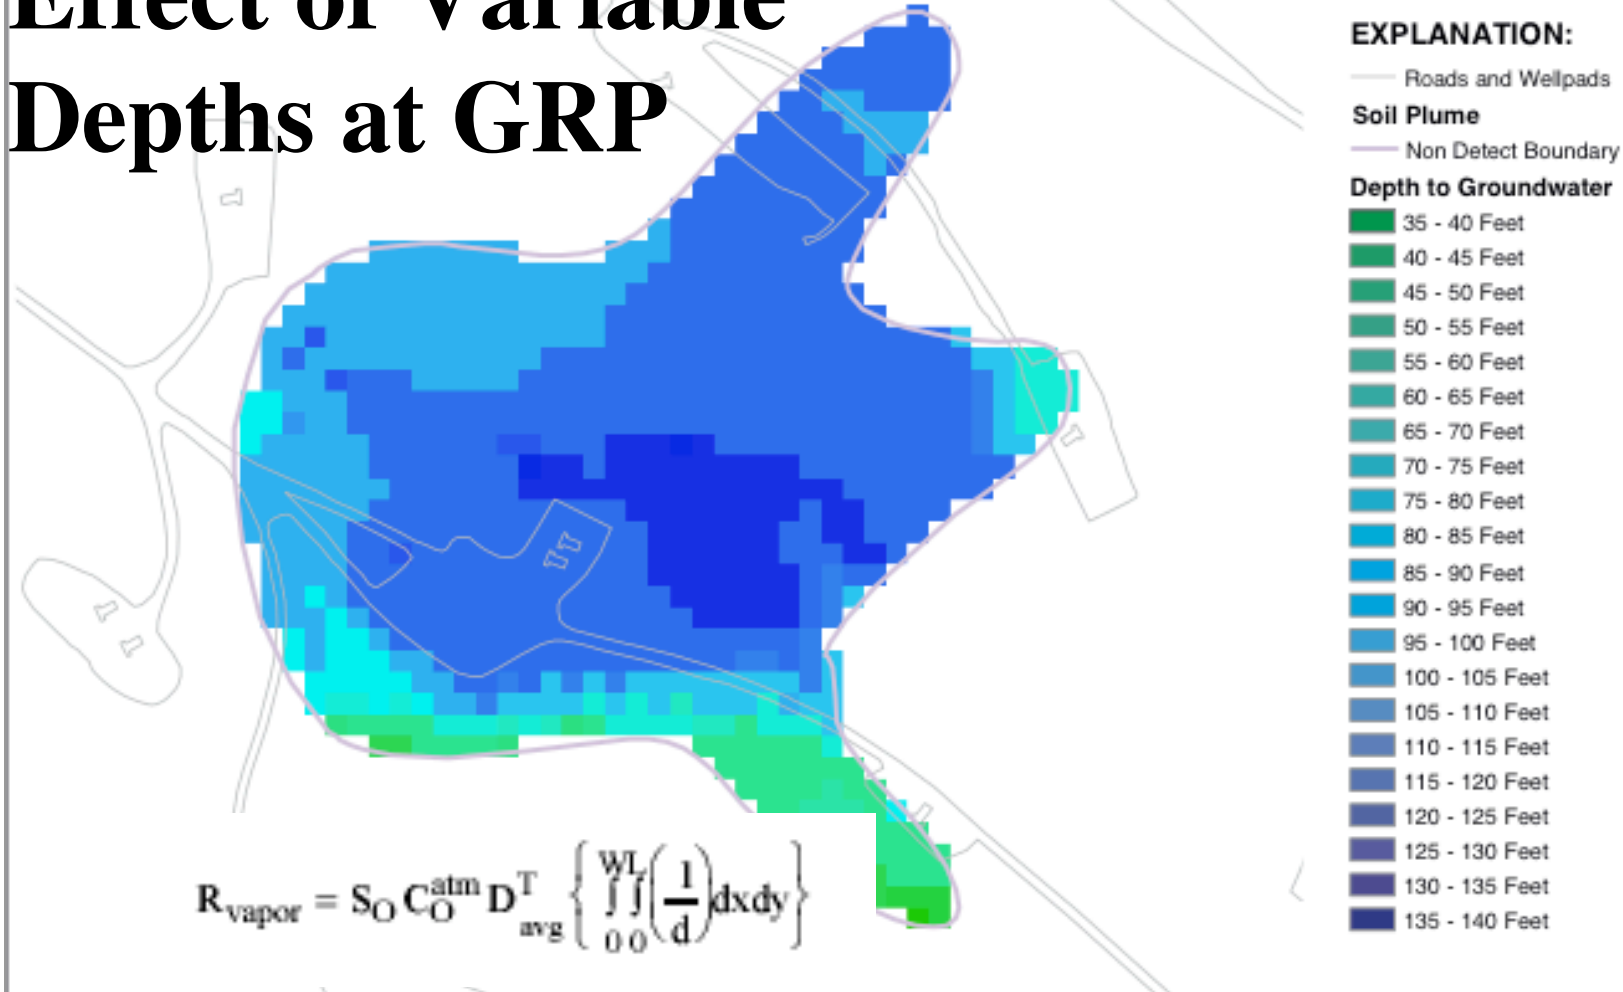

Sample Group II Data Reduction - Vapor-Transport-Related Processes..

$$R_{\text{vapor}} = \int_W \int_L \left\{ -D_{\text{HC}} \left(\frac{\partial C_{\text{HC}}}{\partial z} \right) - S_M D_{\text{CH}_4} \left(\frac{\partial C_{\text{CH}_4}}{\partial z} \right) + S_O D_O \left(\frac{\partial C_O}{\partial z} \right) \right\} dx dy$$

Effect of Variable Depths at GRP

$$R_{\text{vapor}} = S_O C_O^{\text{atm}} D_{\text{avg}}^T \left\{ \int_0^W \int_0^L \left(\frac{1}{d} \right) dx dy \right\}$$

GRP Group II Data Reduction...

| Source Area | Area (m ²) | Average Depth (m) | Average Deff,O ₂ (cm ² /sec) | Aerobic Degradation Rate (kg/year) |
|------------------|------------------------|-------------------|--|------------------------------------|
| Diluent Tanks | 231212 | 18.9 | 0.038 | 1.36 X 10 ⁵ |
| Compressor Plant | 71502 | 32.0 | 0.025 | 1.64 X 10 ⁴ |
| G6 | 9755 | 24.8 | 0.065 | 7.5 X 10 ³ |

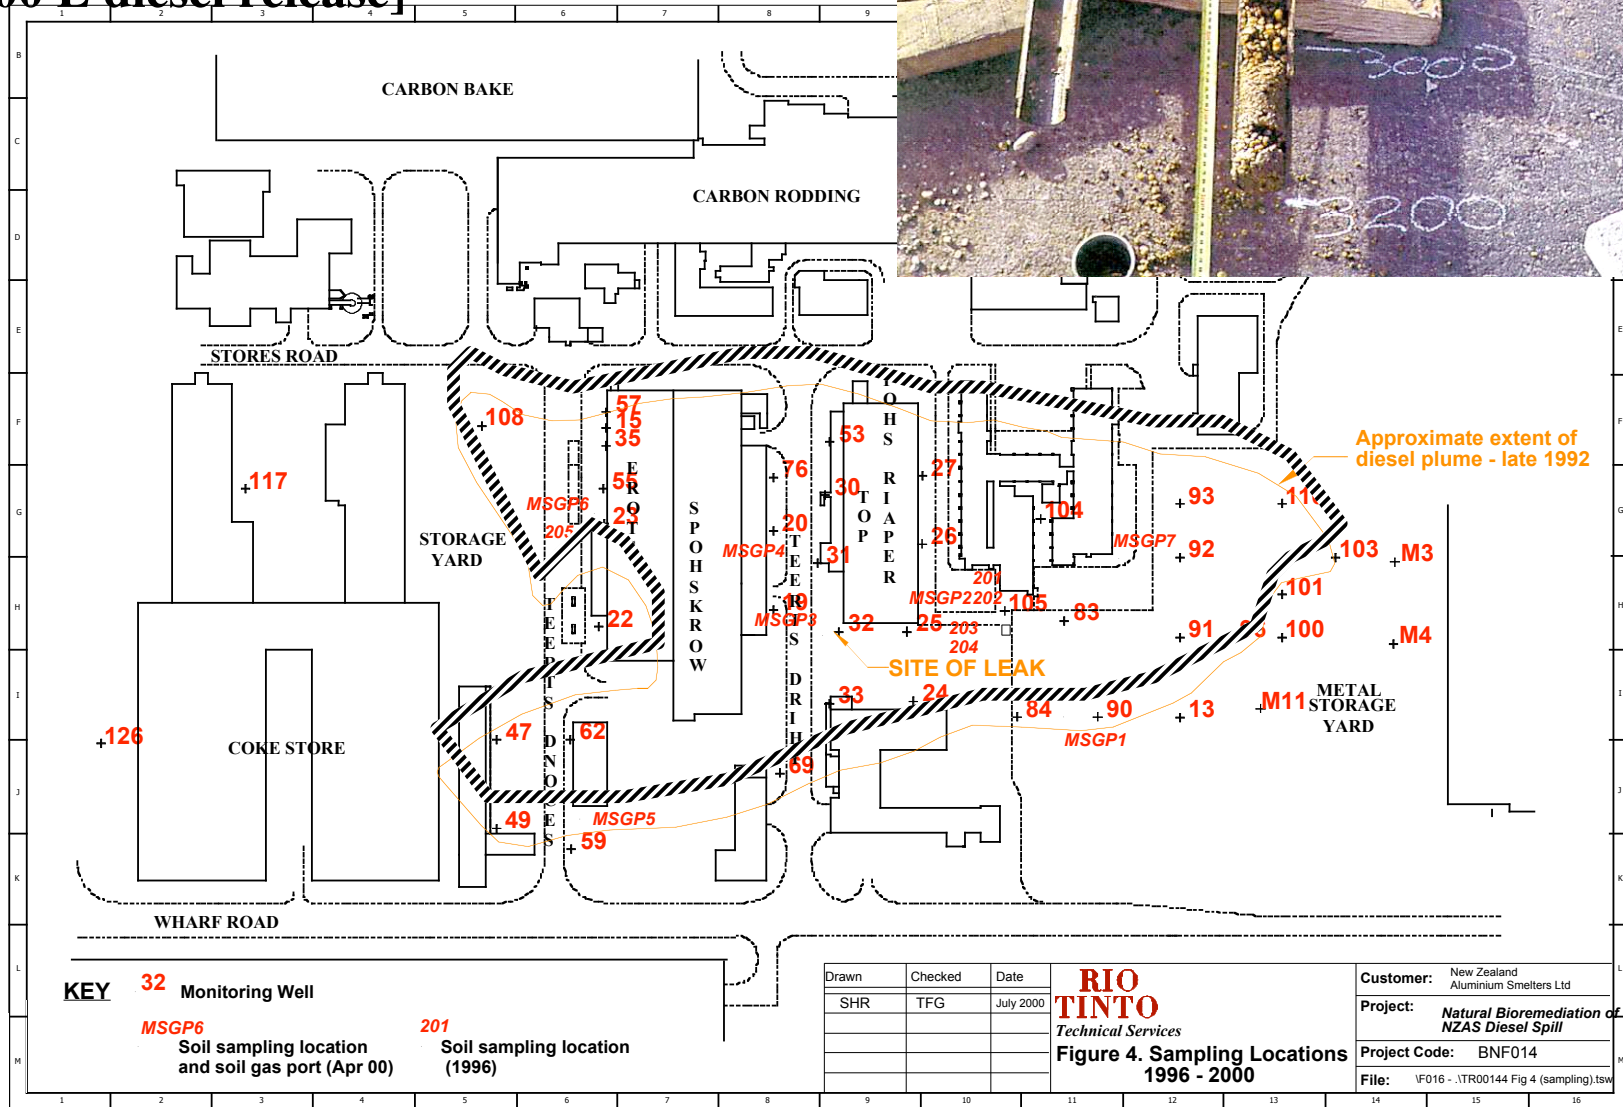

| Source Area | Loss Rate Estimate Due to Dissolution [kg/y] | Loss Rate Estimate Due to Dissolved-Phase Transport-Related Biodegradation [kg/y] | Loss Rate Estimate Due to Oxygen Gas Transport [kg/y] |
|------------------|--|---|---|
| Diluent Tanks | 500 - 1600 | 600 - 1600 | 140,000 |
| Compressor Plant | 300 - 500 | 0 | 16,000 |

- Gas transport-related losses are more significant than dissolved-phase transport related processes, but...
- SZNA rates are quite different in submerged vs. exposed source zone regions...

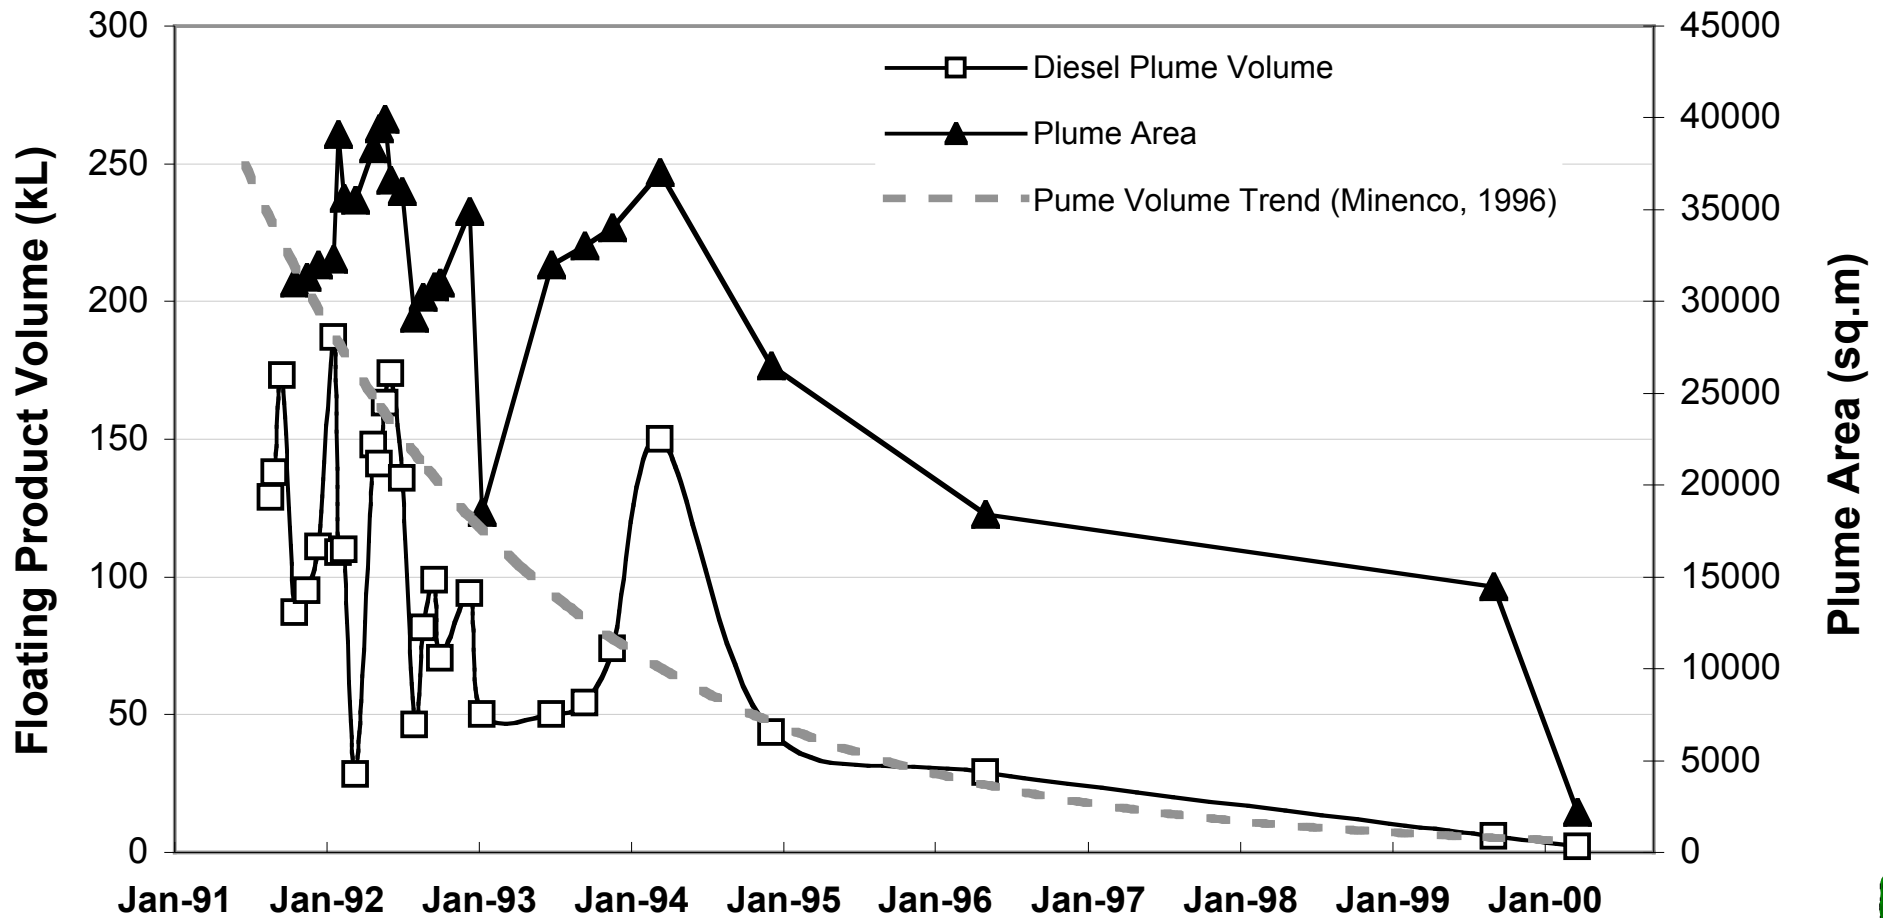

New Zealand Aluminium Smelters Site

[300,000 L diesel release]

NZAS Group II Data Reduction...

Estimated to be about 30,000 L/y from Group II data in 1991 and 12000 L/y in 2000 - vapor transport related processes are dominant at this site

Sample Group III

Data:

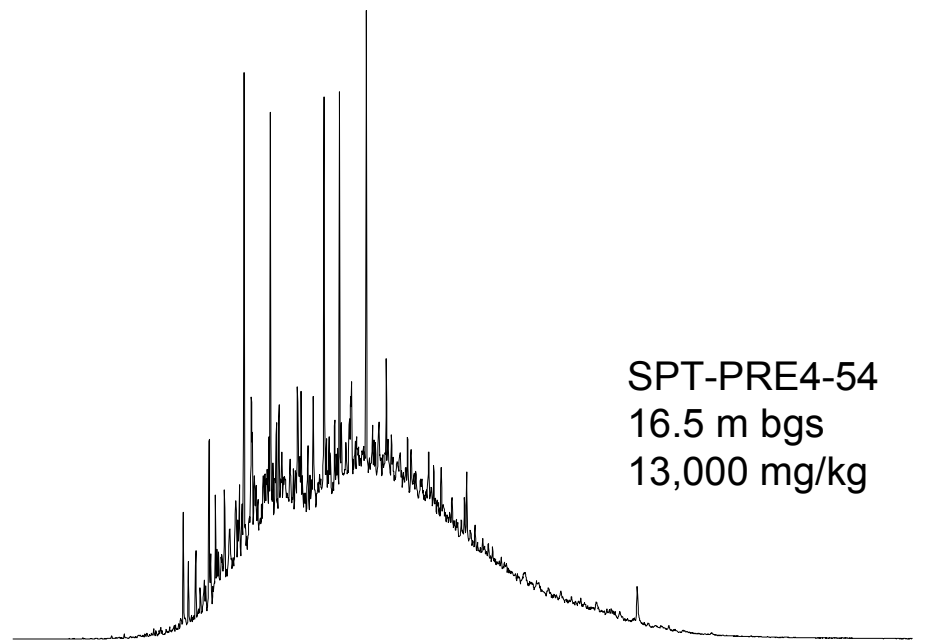

TPH composition analysis with depth at GRP

Accelerated Bench-Scale Volatilization Weathering Test

Field-Scale

Lab-Scale

- Q = 0.0029 m³/d (=2 cm³/min)
- δ = 10 m
- S = 0.2 m³-NAPL/m³-pores
- n = 0.3 m³-pores/m³-soil
- H = 1 m
- D^{eff} = 0.09 m²/d (=0.01 cm²/s)
- $V_{L,0}$ = 2 x 10⁻⁶ m³ (= 2 cm³)

$$T_F = 10^4 T_L$$

$$t_F = t_L \left(\frac{Q \delta S n H}{D^{\text{eff}} V_{L,0}} \right)$$

Accelerated Bench-Scale Volatilization Weathering Test (diluent and diesel)

Summary/In-Progress

- Data-driven framework for SZNA proposed and illustrated; data needs matched with key questions to be answered
- For exposed source regions - major contributor to loss is likely to be gas transport (working in combination with biodegradation for petroleum hydrocarbons)
- For submerged regions - dissolution and biodegradation may be comparable in many cases
- Accelerated bench-scale tests yield insight to future conditions and long-term behavior - especially for complex mixtures
- Fate/transport predictions using “representative compounds” as recommended in TPCWG documents would not match the data collected in this work.
- Sustainability of SZNA (in progress...)
